

Job Description: Senior Full Stack Engineer

Stack: .NET 8/9+, React, AI Agents (Claude/Cursor/Copilot)

About Kibo Commerce:

At Kibo, we believe the future of software isn't just written by humans—it's **orchestrated** by them. We are building a high-velocity engineering culture where AI tools handle the boilerplate, allowing our senior engineers to focus on high-level architecture, security, and complex business logic.

Position Overview:

We are seeking a **Senior Full Stack Engineer** who is an absolute expert in **AI-assisted development**. You are a power user of tools like **Claude, Cursor, or Copilot**, and you understand that "Prompt Engineering" is actually "Context Engineering." Your primary goal is to build and scale our commerce platform using **.NET Core** and **React** at a pace that traditional development cannot match. You will be responsible for defining the patterns that allow AI to generate high-quality, testable, and secure code consistently.

Key Responsibilities:

- **Rapid Feature Prototyping:** Use AI agents to move from a concept or "vibe" to a working MVP in hours, not weeks.
- **Context Management:** Expertly manage IDE context (using `.cursorrules`, MCP servers, or project indexing) to ensure AI outputs adhere to Kibo's specific architectural standards.
- **Full-Stack Orchestration:** Lead the development of complex **.NET microservices** and **React** frontends, utilizing AI to handle 80% of the manual coding while you focus on the critical 20% of logic and integration.
- **AI-First Testing:** Utilize AI to generate comprehensive test suites (nUnit, Jest, Playwright) that ensure high coverage and prevent regressions in an accelerated delivery environment.
- **Code Quality & Review:** Act as the final gatekeeper, ensuring that AI-generated code is not just "functional" but follows **SOLID principles**, security best practices, and performance standards.
- **Database & Messaging:** Architect data solutions in **PostgreSQL** and **MongoDB**, using AI to optimize queries and implement **RabbitMQ** event patterns.

Qualifications:

- **7+ years** of software engineering experience, with the last **1–2 years** focused heavily on AI-augmented workflows.

- **AI Mastery (Required):** Deep expertise in prompt engineering, context engineering, and the use of **AI Agents** (e.g., Cursor's Agent Mode, GitHub Copilot Extensions, or specialized CLI agents).
- **Latest .NET Expertise:** Advanced knowledge of **.NET 8/9+** and C#. You must know how to prompt for the latest syntax and framework features.
- **React & Modern Web:** Mastery of **React**, **TypeScript**, and modern state management (Zustand, TanStack Query, Redux).
- **The "Kibo Stack":** Proven experience with **PostgreSQL**, **MongoDB**, **Redis**, and **RabbitMQ**.
- **Node.js Proficiency:** Ability to navigate and build in Node.js environments when needed.
- **Product Mindset:** You don't just "take tickets"; you use AI to explore solutions and proactively propose feature improvements.

Preferred Skills:

- Experience with **Model Context Protocol (MCP)** to connect AI tools to local and remote data sources.
- Familiarity with **Agentic Frameworks** (LangGraph, CrewAI) or custom AI-orchestration scripts.
- Experience in **Performance Tuning** for AI-generated code (e.g., identifying inefficient loops or redundant API calls).

Why Kibo Commerce?

- **Velocity as a Priority:** We value how fast you can build quality features, and we provide the best AI tools (paid licenses for Cursor, Copilot, etc.) to help you do it.
- **Bleeding Edge:** We aren't afraid of the "New." You'll be working with .NET 9 and the latest React updates as soon as they drop.
- **Empowered Engineering:** You aren't a "coder"—you are a **System Architect** who uses AI to execute your vision.
